Course description:

Biochemistry I is a core course designed for undergraduate students majored in life science programs. Biochemistry is the study of the chemical properties and biological functions of the atoms, molecules, macromolecules, and macromolecular complexes that constitute life. Key topics include the building blocks of biomolecules including carbohydrates, membranes, nucleic acids and proteins. Students will learn the structure, function and biosynthesis of DNA, RNA and protein. Students are advised to read ahead before class to familiarize with the large amount of material that will be covered in the lectures.

Course objectives:

On completion of this course, students will be able to:

1. Explain the basic concepts of biochemistry.
2. Recall and design experiments demonstrating the principles of biochemistry.
3. Evaluate the influence of biochemical principles on social and daily life.
4. Appraise the relevance of the biological sciences in preparing for advanced study in biochemistry and related subjects.
